

Trinity River Restoration Program

Invites the Public to a

Lessons Learned Workshop:

The Evolution of Gravel and Fine Sediment Management on the Trinity River

Wednesday, September 16, 2015 9:30 am – 3:30 pm

Weaverville Fire Hall, 125 Bremer Street

The 2000 Record of Decision directs implementation of a coarse sediment augmentation program below Lewiston Dam. This activity replaces the coarse sediment trapped behind the dams and balances the coarse sediment transported during high-flow releases.

This workshop will be a technical presentation that offers the opportunity to learn about where the Trinity River sediment management strategy started, what methods have changed and evolved, and what has been learned over the last 15 years through adaptive management. Sediment management science continues to evolve; join us to learn where it will lead into the future.

Light morning refreshments will be provided.
